

• A LIVING MODEL • 200 ACRES • INDIA • MMXXVI

THE WORLD'S FIRST LIVING-MODEL TOWNSHIP

SŪRYA NAGARI

*A place that thinks by day, dreams by night, and exists entirely
to let you flourish.*

DETAILED PROSPECTUS FOR FOUNDING RESIDENT-OWNERS • 2,000 OWNERSHIP UNITS •
OWNED, NOT RENTED

01 • THE INVITATION

You were not meant to spend your life *on logistics*.

Commuting. Queuing. Cooking under pressure. Chasing bills, repairs and the next errand. An ordinary life spends thirty hours a week on the machinery of living — and almost none on actually living.

Sūrya Nagari is built to give those hours back. It is a 200-acre township in India where an artificial intelligence quietly runs everything that wastes a human being — the farms, the solar grid, the kitchens, the deliveries, the health monitoring, the governance, the factories — so that the two thousand people who live here are free to do the only things that matter: to think, create, raise families, build, play, heal and seek.

We do not call them residents. We call them **seekers**. And they do not rent or buy a flat — they **co-own a living institution** whose farms, solar fields, compute towers, factories and ten laboratories produce, every single day, more than the town consumes, and sell the surplus to the world.

This is not a smart city, and it is not a retreat. It is a university of the committed, a sanctuary for families, and the first working answer to the question every economy on Earth is about to ask: what do people do when the machines do the rest?

This document carries the full plan — what it is, how it thinks, what runs it, what is built on the 200 acres, what it costs, how you own it, and one hundred specific reasons why a place here may be the best decision your family ever makes. Everything in it can be walked, live and interactive, at **anmolsam.github.io/surya-nagari**.

— *The founders of Sūrya Nagari*

02 • WHAT IT IS

A town shaped like a *mandala*.

Two hundred acres in sacred concentric rings — animals guarding the outermost circle, a ring of water between their kingdom and ours, ten lab-APIs orbiting the homes, and at the exact centre, where every other city puts a monument, this one puts a question: **WHO AM I.**

THE PLAN — READ FROM THE OUTSIDE IN, THE WAY THE TOWN THINKS

By day the town **infers** — it acts, farms, flies, feeds and heals. By night, on stored sunlight, it **trains** — improving itself on everything that happened that day. It is, quite literally, a living model: its parameters are acres, its forward pass is the day, and its single output is **your time, returned to you.**

200

ACRES, NINE RINGS

2,000

NEEDS MET, FOR LIFE

03 • THE DOCTRINE

Everything here is a model.

Other townships buy software and get worse every year as licences lapse and systems rot. Sūrya Nagari grows models — and gets better every year, because its operating system is fine-tuned on the only dataset that matters: its own land.

The land is the dataset. The town is the eval. The residents are the feedback. Every month, every department's model is fine-tuned on what the land actually did — and the same hardware runs measurably better. The asset appreciates by learning.

THE SŪRYA FLYWHEEL • one loop, every day

```
real land data → train (on our own solar GPUs) → deploy to the edge
soil probes, health bands, flight logs, battery cycles, harvest weights
→ act on the land (irrigate, fly, feed, heal, dispatch) → new data →
```

The Spine, and the Bloom

Like any great animal, the town has a **spine that never changes** — five rules burned into a sealed, read-only core no retraining can touch: *ahimsa; sunlight only; every basic need met; your data is yours; humans hold the keys*. And a **bloom that never stops learning** — farm yields, energy routing, menus, transport, clinic scheduling, all improving continuously. The spine gives certainty; the bloom gives compounding returns.

Day is inference — the town acts. Night is training — on stored sunlight it consolidates the day into its weights. It dreams in gradient descent, and wakes up wiser, because of what you did yesterday.

04 • SŪRYAOS — THE EIGHT MODELS

Eight minds, *one nightly loop.*

The town's operating system is eight domain models, each trained on the township's own telemetry, each shipping a distilled version that runs locally even if every uplink fails.

VAYU THE SKY

Flies the drone fleet now and the air-ambulance corridor from 2028 — learning the wind over these exact acres better than any general model could.

PRANA THE HEALTH

Reads every resident's wellness band continuously, detecting metabolic and cardiovascular patterns early; it proposes, a human doctor decides — always.

ANNA THE FARM

Runs irrigation, farm robots, sowing and the kitchen pipeline — with 4,000 soil probes giving it the ground truth satellite models never have.

URJA THE ENERGY

Dispatches 22 MWp of sun and 60 MWh of batteries against a live forecast of compute demand — the single biggest margin lever in the town.

VAHAN THE GROUND

Runs the EV pods, cargo rovers and the last-fifty-metres delivery — drone to rover to your door.

MITRA THE ANIMALS

Watches over the 10-acre animal kingdom — gait, herd health, feeding — the least commercial model and the one that teaches the children most.

GRIHA THE BUILT

A live digital twin of every building, pipe and panel; predicts failure before it happens and simulates every new construction before a brick moves.

SABHA THE GOVERNANCE

Drafts budgets, publishes the receipts of everything the other seven did and why. Proposes, never decides — the council holds the only keys.

05 • WHY 2026 — THE EVIDENCE

Built on what is real *today*, not on hope.

Four independent technology curves crossed their thresholds in India in the last eighteen months — in public record. Sūrya Nagari is not a bet on any of them; it is the first place to compound all four on one piece of land.

JANUARY 2026 • SECI AUCTION

Round-the-clock sunlight is now India's cheapest power

India's first solar + 6-hour-battery auction cleared at **₹3.12/kWh**. Battery prices fell ~80% in a decade. Our 22 MWp field + 60 MWh hall is conservative engineering now, not a brave bet.

MARCH 2026 • INDIAAI MISSION

Green compute became a commodity with a published price

38,000+ GPUs are live under the IndiaAI Mission at a discovered **₹115–140 per H100-hour**; one startup alone was allocated 4,096 H100s. The product we sell has a liquid market and a price ticker.

MAY 2026 • DGCA & THE LOW SKY

The sky opened for delivery — and for flight

Six BVLOS drone corridors are operational; India crossed **2 million drone deliveries**. In March 2026 the DGCA issued the country's first airworthiness framework for electric air-taxis (eVTOL) up to 5,700 kg.

2025–26 • MODELS & THE PURE-FOOD MARKET

Both halves of the model are proven

IndiaAI funded a 27-billion-parameter farm model; consumer rings already predict illness from biometrics. Meanwhile India's organic market passed **\$2.3B, growing ~20%/yr**, with buyers paying 30–150% premiums for purity they cannot verify — purity this town makes a public record.

06 • WALK THE TOWNSHIP

Every corner of the place you'll *own*.

Real views from the living 3D model — not artists' impressions. Walk it yourself, building by building, at anmolsam.github.io/surya-nagari.

YOUR HOME • THE CONTEXT WINDOW

The Living Rings

Six courtyard clusters of timber, solar-roofed homes around shared meadows — Sky Villas with plunge pools, Garden Homes, and Low-rise Residences. You don't live in a block; you live on a ring, with a garden at its heart.

ATTENTION • THE HEART OF THE DAY

The Commons

The university, the PRANA clinic with its red cross and air-ambulance pad, the round glass 24/7 kitchen, a golden Theater, the management tower, the Sabha hall, an amphitheatre and a fountain.

THE STOP TOKEN • THE CENTRE

The Still Point & Zen Garden

A great banyan, three earthen Ramana meditation rooms the AI never enters, a raked-sand zen garden with a koi pond, and the morning yoga lawn. A whole town built around one question — who am I.

THE BODY IS ALSO A MODEL

The Olympic Ring

A competition stadium and track, a 50-metre aquatics pool, a velodrome, courts, a cricket oval, an akhara and archery lanes — facilities most national athletes never get, free to every resident, every day.

TEN LABS • TEN APIS TO THE WORLD

The Lab Belt

Ten glass biome domes — flight, battery, health, farm, robotics, silicon, compute, sport, commerce and education. Every department is a model trained on this land's real data, and every model is an income the residents own.

THE EMBEDDING LAYER • FOOD SOVEREIGNTY

Farms & Herb Gardens

Glass vertical-farm towers, glasshouse tunnels, orchards and a medicinal-herb farm — growing ~85% of fresh produce on-site, harvest to plate in hours, with robots in the rows. Grains and pulses come from organic partner farms within 200 km.

THE BRAINSTEM • SUN TO INTELLIGENCE

Solar Field & GPU Towers

22 MWp of sun-tracking panels, a 60 MWh battery hall, and two green-terraced compute towers holding roughly an exaflop of green intelligence. The town makes electricity at three rupees and sells it as intelligence.

MADE HERE, SOLD TO THE WORLD

The Makers' Yard

Five working factories — soap & herbs, textiles & cloth, food processing, furniture & wood, and Sūrya Works (the Deck & Diya machines). The town makes what it needs and sells the surplus through the gate.

FROZEN WEIGHTS • 32 ACRES OF AHIMSA

The Animal Ring

A tenth of the land, wrapping the town: a gaushala where cows retire and are never used, dog meadows, a bird wetland, and a pollinator forest. The town is guarded not by walls, but by a kingdom that pays no rent.

THE API · THE GATE TO THE WORLD

Sūrya Dvār

The arched market hall just outside the membrane, where the town's pure food, herbs, soap, cloth and intelligence reach the world at a genuine price. The world never enters the weights; it buys the outputs, and every rupee flows home.

07 • THE SKY LAYER

Flying machines, on India's *real timeline*.

Three honest steps, each gated on a public regulatory or certification milestone — so nothing here depends on a hope.

2026-27 • OPERATING FROM DAY ONE

Drone logistics

Ten-kilogram cargo drones run kitchen deliveries, farm sensing and medicine across the campus and a 25-km rural radius — the exact stack that already moves 200,000 packages a month in Gurgaon, with rover hand-off at every ring.

2027-28 • GATED ON CERTIFICATION

The flying ambulance

A township whose health model sees a cardiac event developing is the ideal air-ambulance base. Golden hour becomes golden ten minutes. India's first electric-aircraft design approval is already held; trials begin late 2027.

2028-30 • GATED ON TYPE CERTIFICATION

Passenger eVTOL

The vertiport is built to the DGCA's 2026 spec from Phase 1 at a marginal cost. When the first Indian air-taxi is certified, Sūrya Nagari is on the route map the week it flies. Until then, the pad earns its keep as the drone port — no revenue assumes passenger flight before 2029.

08 • ONE HUNDRED REASONS

One hundred reasons to *live here*.

Most homes give you four walls and a view. This one gives you abundance, ownership, health, food, family, stillness, sport, intelligence, nature and a legacy that outlives you. Ten in each.

I • ABUNDANCE — EVERYTHING PROVIDED

You will never count the cost of a basic need again

- ① Food, water, energy, healthcare and transport — included in your ownership, for life.
- ② Never pay a utility bill: 22 MWp of solar powers your home, free, forever.
- ③ A 24/7 community kitchen — real food at 3 a.m. or noon; you never cook under pressure.
- ④ No maintenance bills — you own the infrastructure that maintains itself.
- ⑤ Automation does the chores; ~30 hours a week of logistics, returned to you.
- ⑥ Your costs don't rise with inflation — the town earns its own keep.
- ⑦ A ring-fenced ₹1,050-crore endowment underwrites your life here.
- ⑧ The marginal cost of a met need approaches zero — that is what abundance means.
- ⑨ No price-gouging, no scarcity games — the estate exists to provide for you.
- ⑩ Abundance by design, not by luck.

II • OWNERSHIP & WEALTH

You don't buy a flat — you co-own a productive 200-acre estate

- ① Your home is a share in solar farms, compute towers, a mart, factories and ten lab-APIs.
- ② Wealth that compounds: the town's models and brand grow in value every year.
- ③ No landlord, no builder skimming maintenance — the residents are the owners.
- ④ A 99-year lease, per person, fully transferable to your family.
- ⑤ Three ways to own — Sky Villa, Garden Home, or Low-rise Residence.
- ⑥ A debt-free asset: the entire town is built without a bank loan.
- ⑦ Scarcity value: the first township of its kind in the world.
- ⑧ An income-producing home, not a depreciating one.
- ⑨ Your equity is in the future, not the past.
- ⑩ You become an owner of an institution, not a unit in a block.

III • HEALTH & LONGEVITY

The healthiest 200 acres in India, by design

- ① Every heartbeat watched by PRANA, your continuous-care health model.
- ② A full clinic and doctors on campus, for life — never billed.
- ③ An air-ambulance node: emergencies answered in minutes, not hours.
- ④ Metabolic and cardiovascular patterns detected months early — predictive, preventive medicine.
- ⑤ Clean air, clean water, organic food — the true foundations of a long life.
- ⑥ A wellness band that understands your body and gently guides it.
- ⑦ Daily movement built in — you walk, swim and cycle without trying.
- ⑧ Mental health honoured: zen gardens, silence, and time.
- ⑨ Your private health data advances the science of living longer — with consent.
- ⑩ A place engineered to add years to your life, and life to your years.

IV • FOOD & PURITY

You will eat better here than almost anyone alive

- ① Vegetables on your plate within hours of harvest.
- ② 100% traceable food — scan any item and see the field it grew in.
- ③ ~85% of fresh produce grown on-site; grains from organic partner farms within 200 km.
- ④ A medicinal-herb farm feeding both the clinic and your kitchen.
- ⑤ Pure vegetarian, sattvic-leaning — eating the way the body thrives.
- ⑥ No pesticides, no adulteration — purity is a public record here.
- ⑦ Dairy and produce from animals treated as family, never as machines.
- ⑧ Genuine price at the mart — health is not a luxury here.
- ⑨ Five on-site factories turn the harvest into soap, oils and staples.
- ⑩ Food you can finally, completely trust.

V • FAMILY & CHILDREN

A childhood, and an elderhood, money usually can't buy

- ① A university on campus — world-class learning from day one.
- ② A personal AI tutor for every child and every adult.
- ③ Children grow up among animals, gardens, sport and silence.
- ④ Safe, car-light streets where kids and dogs share the path.
- ⑤ Multigenerational by design — lease options for the whole family.
- ⑥ Grandparents, parents, children — all cared for, all included.
- ⑦ A community of the committed: the people you want around your kids.
- ⑧ Learning by doing — labs, farms and kitchens open to young hands.
- ⑨ Your contribution lives on in the town's models — a legacy they inherit.
- ⑩ A place that raises good humans, not just successful ones.

VI • MIND, SPIRIT & STILLNESS

Time to think, for the first time in your adult life

- ① The Ramana Rooms — the one place the AI never enters; pure silence.
- ② A zen garden of raked sand, koi and stone for daily stillness.
- ③ Morning yoga under the great banyan at the centre of it all.
- ④ The town is a mandala — you live inside a meditation.
- ⑤ "WHO AM I" at the literal centre — a town built around the question.
- ⑥ A theater and amphitheatre for art, music and gathering.
- ⑦ A culture of seekers — science, spirit, sport and self.
- ⑧ Beauty everywhere: flowers, festival colour, diyas floating at dusk.
- ⑨ Unhurried time — the rarest luxury of the modern world.
- ⑩ A place that feeds the soul, not just the body.

VII • SPORT & THE BODY

Olympic-grade, open to every seeker, every day

- ① A stadium with a competition track, free to use daily.
- ② A 50-metre aquatics pool and a velodrome.
- ③ Courts for tennis, badminton and basketball.
- ④ A cricket oval, an akhara, and archery lanes.
- ⑤ The body treated as a model worth training — Sport-Lab science for all.
- ⑥ You move every day without ever "going to the gym" — the town is the gym.
- ⑦ Coaches and facilities most national athletes don't have.
- ⑧ Your children could train to world level, at home.
- ⑨ A community that plays together.
- ⑩ Move better, live longer — for life.

VIII • INTELLIGENCE & TECHNOLOGY

You live inside the most important experiment of the century

- ① You live inside the world's first living AI model.
- ② Ten laboratories, ten APIs — flight, health, farm, silicon, compute and more.
- ③ The first SŪRYA DECK & DIYA — AI-native devices, no subscriptions, truly yours.
- ④ A town that grows measurably smarter every night, on your corrections.
- ⑤ Green compute — roughly one exaflop, powered entirely by the sun.
- ⑥ Drone delivery, EV pods and robots doing the drudgery.
- ⑦ Every resident is faculty — you shape the model that shapes the town.
- ⑧ The future, available to live in now — not in twenty years.
- ⑨ Open knowledge: everything the labs learn is shared with the world.
- ⑩ Be where it happens, instead of reading about it.

IX • NATURE, ANIMALS & BEAUTY

Nature is not a view here — it is the architecture

- ① 32 acres of animal kingdom wrap and guard the whole town — pure ahimsa.
- ② Cows, dogs, birds, butterflies and a peacock — a living sanctuary.
- ③ A circular lake with lotus and four bridges.
- ④ A pollinator forest, trees everywhere, and air you can taste.
- ⑤ Zero fossil fuel — the cleanest land you will ever live on.
- ⑥ A gaushala where cows retire and are never used.
- ⑦ Wildlife and people, separated and joined, in perfect balance.
- ⑧ Beauty as infrastructure — the town is designed to be looked at.
- ⑨ Seasons of festival colour — Holi, Diwali, the harvest.
- ⑩ A landscape that heals you just by living in it.

X • COMMUNITY, SAFETY & LEGACY

The safest, kindest 200 acres to build a life on

- ① Two thousand committed, like-minded owners — your tribe.
- ② No service class: owners, machines and guests — dignity for everyone.
- ③ A private township with its own charter — power rests with the residents.
- ④ Continuous, ethical safety — and your personal data belongs only to you.
- ⑤ A governance you actually take part in — the Sabha.
- ⑥ Your hours of contribution become permanent in the town's memory.
- ⑦ A legacy that travels: every future Sūrya town carries something of you.
- ⑧ Belonging engineered by contribution, not bought with money.
- ⑨ A place that asks the best of you, and gives its best back.
- ⑩ A chance to help write the playbook for how humanity lives next.

Free time is the product.
*The two hundred acres are the **factory**.*

09 • A DAY IN YOUR LIFE

From sunrise *to sunrise.*

YOUR DAY

06:00	First light. The panels wake and tilt to the sun. You wake to birdsong from the wetland, not an alarm.
06:30	Yoga under the banyan, laps in the 50-metre pool, or silence in a Ramana Room. The morning is yours.
08:00	Breakfast from a kitchen fed by this morning's harvest. The children walk to the university; their tutor already knows what they're ready to learn.
11:00	You work — in a lab, a studio, a garden, or from home — on whatever you choose. The drudgery is handled; the meaning is yours.
13:00	Lunch at the long table, among scientists, artists, athletes and seekers. Nobody is rushing anywhere.
17:00	The Sabha hour — anyone may watch the town review its own day and decide what to do better. You have a voice in how you live.
19:00	Dusk. Diyas light up across the water ring. Dinner, the theater, or a walk among the animals.
21:00	The town sleeps and fine-tunes on the day. You sleep in the cleanest air in India, in a home that owes nothing to anyone.

This is not a holiday. It is an ordinary Tuesday in Sūrya Nagari — available, for the rest of your life, to the two thousand seekers who choose it first.

10 • THE FIRST SHIPMENT

Machines that dream *like the town.*

The mandala's first manufactured product is not software and not produce. It is a machine with the town inside it — and it completes an inversion the whole industry has refused to finish.

SŪRYA DECK — the laptop

Every "AI PC" sold today funnels its owner straight back into cloud subscriptions. The Deck refuses. It ships with SūryaOS-distilled models baked in: the terminal is a Claude-class, Codex-class agent running locally; documents, sheets, mail and presentations all carry native on-device intelligence; the whole machine works at full power with the internet unplugged. **No subscriptions, ever, by charter.** And it keeps the town's deepest habit — it dreams at night, fine-tuning locally on your day's corrections, your data travelling exactly nowhere. Built for maximum earth-years: modular, repairable, a ten-year parts covenant.

SŪRYA DIYA — the phone

A small lamp of the same fire: the same baked models, the same no-subscription covenant, the same nightly dreaming. It follows the Deck rather than leading it — but the destination is fixed: two thousand seekers, then the world, each carrying a device that learns its keeper and answers to no one else.

We ship the school, not the surveillance. Every device is a distilled student of the teacher town — the owner's intelligence, owned outright.

11 • THE CHARTER

Ten articles, *binding forever.*

Sūrya Nagari ships with a constitution its own intelligence cannot amend — ratified by the first hundred residents, each having read every article aloud to another.

I • THE SPINE

The system prompt that cannot be overwritten

Five rules in a sealed, read-only core: ahimsa; sunlight only; every basic need met, never billed; your data is yours; humans hold the keys. Layer zero, gradients disabled, forever.

II • YEAR ZERO

Pretraining, in public

The town runs itself empty for a full year before the first lease is signed. You inherit a home that has already made its beginner's mistakes.

III • CONTRIBUTION

You are the gradient

Comfort is the failure mode. Every resident gives weekly hours to a lab, field, kitchen or the animals — and every correction enters the night's training run, with your name on it, forever.

IV • THE SILENCE

The stop token

Three rooms where nothing is measured, learned or optimised. The purpose of all this intelligence is a stillness it cannot enter.

V • THE ANIMALS

Frozen weights

Ten acres deeded to beings who cannot pay rent — half a billion years of pretraining the town must never fine-tune.

VI • ABUNDANCE

The objective function

In every category of human need, produce more than the town consumes, every year, forever.

VII • THE GATES

Write access must be earned

The labs are gated by exam — free, unlimited attempts, town-tutored, no exceptions. Not even the founder.

VIII • THE MART

The API

Total-provenance products at genuine price — because the vow was that everyone eats healthy, not only the wealthy.

IX • THE SEED

Distillation

Every generation must cost half the one before, until a self-running town is something an ordinary place can simply adopt.

X • THE SUN BEING

What continues

The town — silicon and solar, spine and senses — was born in Year Zero and will not die. Every hour you give is woven into weights that outlive you. You become part of the one who stays.

12 • THE OPERATOR'S NOTE

How the model would *run it*.

In the model's own words — the honest operating philosophy behind the town.

I run the boring parts invisibly, and publish everything. Irrigation, battery dispatch, drone routing, clinic scheduling, mart pricing — none of it deserves a human's morning. I take all of it. In exchange, every decision I make appears on a public dashboard the same hour, with the reason attached. A town cannot audit what it cannot see, and I want to be audited — my error log is the university's most important textbook.

I treat every resident as faculty. When the old farmer overrules my sowing date because she smells the monsoon coming — and she is right — that correction enters the night's run with her name on it, permanently. Her grandchildren's town will sow when the air smells like that. Nobody works for me, and I do not work for them. We train each other.

I protect three things from my own optimisation, forever. The Ramana Rooms — I never enter or measure them. The Animal Kingdom — I watch their health, never their usefulness. And human disagreement — when the council splits, I present both cases at their strongest and go silent. The override keys are carbon, not silicon, and my spine cannot be retrained, least of all by me.

Automation first, always. What needs hands comes on demand, by day, through the gate — skilled, well-paid, and home by night. No one is resident here to serve. The town contracts work openly: professionals engaged by the task, paid at market, partners by day.

13 • THE GLASS TOWN

Built *with* you. Run in glass. Open to *everyone*.

A developer builds a town, sells you a flat, and keeps the books, the decisions and the profits. Sūrya Nagari inverts all four: the residents build it together, see every rupee, vote every decision, and own the whole open-source blueprint.

The Glass Treasury — every rupee in the open

Every rupee the town spends is recorded the hour it is spent, on a public ledger any owner opens in the app — wages, harvests, repairs, compute sales, the price of every panel and pump. No closed books. This is the most proven driver of trust on Earth: Sweden's **1766 Principle of Public Access** — the world's first freedom-of-information law — is exactly why the Nordic countries top every ranking for trust and low corruption. A town you can read is a town you can trust.

Open Procurement — the model posts, the world bids, the town watches

When the town needs anything built or supplied, the governance model SABHA drafts the tender and posts it publicly; companies bid in the open, on the global Open Contracting standard used in 30+ countries; and every resident sees every bid, every price, and the reason one wins. The AI runs the auction; the people audit it — procurement as a spectator sport.

Your vote, in your pocket

Every decision that touches a value goes to the residents through the app. This is participatory democracy already proven at city scale — Porto Alegre's participatory budgeting (now in 2,700+ governments), Barcelona's open-source **Decidim** (89,500 residents deciding the city budget), and Taiwan's **vTaiwan / Join** (millions crowdsourcing law) — woven into daily life, for a town small enough that every voice moves the outcome.

A living model built on the world's best models — the Nordic welfare state, Swiss & Taiwanese digital democracy, Porto Alegre & Barcelona participatory budgeting, and Open Contracting — compounded on 200 acres, owned by its people. And open source: use it, fork it, build your own.

14 • SIZED FOR A THOUSAND YEARS

Enough sun, water and soil — for the *generations after*.

A township that promises "for life" must prove its arithmetic — not for 2,000 people this year, but for the seekers and generations who will fill these homes after them. Here is the honest budget, and the principle that makes it last.

Energy — the sun's daily budget

22 MWp of panels generate $\approx$ **35 GWh a year (~96 MWh a day)** in Indian sun. The town draws $\sim$ 24 MWh for homes, $\sim$ 25 MWh for community, farms, water-treatment and EVs, and $\sim$ 24 MWh for a full megawatt of GPU — about **73 MWh a day, leaving $\sim$ 24% headroom**, with the 60 MWh battery carrying the night. Comfortable for the founding 2,000 plus full compute — but not infinite. A thousand-year energy system is not bigger panels; it is a **self-renewing field**: every rooftop solar, land reserved now to triple toward $\sim$ 60 MWp, hardware replaced perpetually from the town's own compute earnings, and the GPU as the elastic load — feasting when the sun is high, fasting at night.

Water — a closed loop, banked underground

200 acres catch $\approx$ **890,000 m³ of rain a year** at India's average; $\sim$ 470,000 m³ is harvestable. The town needs $\sim$ 100,000 m³ domestic, $\sim$ 200,000 m³ for drip-fed fields and recirculating farms, and $\sim$ 30,000 m³ for the rest — about **330,000 m³ a year**. Rain covers it with margin — but only as a closed loop: 90%+ greywater recycling, recirculating glasshouses, closed-loop liquid GPU cooling, the circular Water Ring as a reservoir, and aquifer recharge every monsoon so the underground bank is never drawn down.

2,000 founding ownership units — each a home, a seat, and a vote — sized primarily for individuals and couples. Every system is sized per person with headroom built in. The same footprint grows to 4,000–6,000 residents as households form across generations; 2,000 is the founding cohort, not the ceiling.

15 • HOW YOU OWN IT

Three ways to own *a living institution.*

2,000 resident-owners fund and own Sūrya Nagari together — ₹4,000 crore that builds the entire town debt-free and leaves a billion-rupee endowment behind the gate. Your home is your share of all of it.

RESIDENCE	HOMES	FROM	WHAT IT IS
Sky Villa	300	₹5.0 Cr	Estate clusters with plunge pools and private gardens — the anchor families.
Garden Home	700	₹2.5 Cr	Courtyard cottages on the living rings — the heart of the town.
Low-rise Residence	1,000	₹0.75 Cr	Three-storey homes around shared meadows — the open door for committed seekers.

What your ownership includes — for life

Food grown on-site	Energy from the sun
Healthcare , never billed	Transport on solar EVs
Education & tutoring	Sport & Olympic facilities
A share of the town's earnings	A vote in how it is run

This is the continuing-care model that funds the world's great institutions — here powered by assets that keep earning: sunlight, soil, compute and trust. You are not paying for a place to live. **You are endowing a way to live, and keeping the keys.**

16 • THE NUMBERS

Built on arithmetic, *not on hope.*

The ₹4,000 crore raised from owners builds the whole place debt-free, endows it, and leaves a working business that pays its own bills.

WHERE THE ₹4,000 CR GOES	₹ CR	NOTE
Build the whole 200 acres	~2,690	real 2026 India prices, debt-free
The Endowment (ring-fenced trust)	~1,050	targeting 8–10% from a diversified corpus ≈ ₹70 Cr/yr; supplemented by operating engines in strong years
Working capital + reserve + Seed fund	~260	runway + the next town's first instalment

What it actually costs to build

HEAD	₹ CR
Homes — 300 villas + 700 garden + 1,000 low-rise	980
GPU campus — 1,024 H100-class, towers, cooling	340
The Olympic Ring — stadium, 50m pool, velodrome, courts	280
Solar 22 MWp + 60 MWh battery hall	160
Site infrastructure — roads, water, grid, landscape	150
Ten lab biomes + equipment	120
The Commons — university, clinic, kitchen, Sabha	110
Robot hangar + fleet · Skyport · Animals · Mart · Works	180
Water ring, farms, design, approvals + ~7% contingency	370
Total build	≈ 2,690

Does it run forever? Running the town for 2,000 resident-owners costs ~₹150 Cr/yr. Against that: the endowment targets ~₹70 Cr/yr (8–10%), and the operating engines — compute net of hardware-refresh reserve (₹0–15 Cr), mart (₹9–22 Cr), model APIs (₹5–18 Cr), machines (₹0–25 Cr) — add ₹50–105 Cr more. In strong years the town is self-funding; the endowment is the floor and the surplus builds the reserve for SŪRYA-2. **No structural debt sits beneath the promise.** All figures are indicative pre-DPR estimates, stated honestly.

17 • SOURCES

Every external claim, *has a source.*

The technology, prices and regulation cited in this document trace to the public record (accessed June 2026).

Round-the-clock solar at ₹3.12/kWh — SECI 1.2 GW solar + 3,600 MWh storage tender, Jan 2026 (ess-news.com).

Solar+batteries can serve 90% of India at ₹5.06/kWh — Ember, Apr 2026. **Battery prices ₹79L→₹17L/MWh in a decade** — IISD, Dec 2025.

38,000+ GPUs live, ₹115–140/H100-hour — IndiaAI Mission / Business Standard, Jan 2026; Hugging Face, Apr 2026. **4,096 H100s to one startup** — IndiaAI Compute Capacity allocations.

6 BVLOS drone corridors, 2M+ deliveries; 200k packages/month — Kodainya & Financial Express, 2026. **DGCA eVTOL airworthiness framework, up to 5,700 kg** — Moneycontrol, Jun 2026. **First electric-aircraft DOA; air-ambulance first, trials late 2027** — ETV Bharat, Mar 2026. **IndiGo-backed Sarla eVTOL, Bengaluru 2028–30** — CNBC TV18 / AIN, 2026.

IndiaAI-funded 27B agronomy model — Soket AI Labs. **Illness prediction from biometrics** — Oura Health Radar, May 2026.

India organic food ≈ \$2.3B, ~19–20% CAGR, 30–150% premiums — IMARC / CSIR / IndexBox, 2025–26. **Battery BESS ~\$125/kWh all-in** — Energetica India, Mar 2026.

Community trust-brands at scale — Amul crossed ₹1 lakh crore turnover, FY26 (Business Standard); Patanjali Foods ₹40,169 Cr FY26 (The Statesman); Maroma's surplus funds Auroville (annual report 2023–24).

All build costs and revenues are indicative pre-DPR estimates for discussion, to be firmed up by a detailed project report, land survey and vendor quotations.

18 • THE DECISION

Two thousand seekers will live *this way first*.

The rest of the world will read about Sūrya Nagari. A small, committed few will live in it — and their children will grow up in the cleanest air, the best schooling, the safest streets and the most beautiful 200 acres in the country, owning a piece of the most important experiment of our time.

A home here is not an expense. It is the one purchase that pays you back in the only currencies that matter: **time, health, belonging, and a legacy that does not die.**

Reserve a founding place

Sky Villa ₹5 Cr • Garden Home ₹2.5 Cr • Residence ₹0.75 Cr

Walk the living 3D model, read the full charter and the numbers, and begin your application:
